1 # gnosis
2
3 Welcome to gnosis!
4 This is a Redmine Plugin with the goal of making your
development process easier to keep an overview of.
5
6 ## What does this plugin do?
7 Gnosis is able to show you GitHub Pull Requests and
Deployments that belong to a Redmine issue, all in its "details"
page.
8 To make this magic work there are only a few steps you have
to follow and certain conventions to keep in mind.
9
10 #### GitHub Webhooks configuration
11 To configure the GitHub Webhooks, go to github.com/your\_org/your\_repo/settings/hooks. There you click on
12 "Add Webhook". The "Payload URL" is your Redmine URL + /
github_webhook. The secret is up for you to decide. It's
13 important that this string is complex and secure. Then, you
get into your `config/application.yml`, where you add the
14 key as your `GITHUB_WEBHOOK_SECRET`. Click "Let me select
individual events." and choose "Pull Requests".
15 You should now be good to go!
16
17 #### SemaphoreCI Webhooks configuration
18 **Important:** The GitHub notifications work without the
SemaphoreCI setup. If you don't use a CI or just a
different
19 you can skip this step.
20 To set up the SemaphoreCI Webhook go to your\_org.semaphoreci.com/notifications and click on "New
Notification".
21 Attributes like "Name of the notification" can be chosen
freely. What you need to setup is: Listing your project
under
22 "in projects", having `.*-deploy\.yml/` under Pipelines (this
just tells the notification to send data every time a
23 deploy script is done running), adding your Redmine URL + /
semaphore_webhook to "Endpoint" and typing `WEBHOOK_SECRET`
24 into the "Secret name" field.
25 Then go to your\_org.semaphoreci.com/notifications and click
on "New Secret". The "Name of the Secret" should be
26 `WEBHOOK_SECRET`. Then you create an environment variable
with the "Variable Name" `WEBHOOK_SECRET`. The "Value" is
the
27 secret. This should match the `SEMAPHORE_WEBHOOK_SECRET` in
your `config/application.yml`.
28 This should now also work just fine!
29
30
```

```
31 ### GitHub Access Token
32 This app needs to query your repository every now and then
   , so its able to know which deployment belongs to which
   pull
33 request. For that you need to set the `GITHUB_ACCESS_TOKEN
   ` in your `config/application.yml`. To create it, go to
34 github.com/settings/tokens and click on "Generate new token"
   ". There click the "(classic)" option. It only needs "repo"
35 access to work.
36 If you make a deploy, it should correctly show now.
37
38 ### Conventions you need to keep
39 The plugin needs information on which Pull Requests belong
   to which issues, which is why there are set conventions for
40 branch naming. When you create a branch that is connected
   to a certain Issue it should be named as follows:
41 something/issue_number-description. The only important part
   of this is the /issue_number as that's how
42 the plugin is able to connect PRs to issues.
43
44
```

```
1 coverage  
2 application.yml  
3
```

```
1 = gnosis
